Std VIII SOCIAL SCIENCE

Resource Utilisation and Sustainability

EXPECTED QUESTIONS FOR EXAMINATIONS

1.What is called a resource ?

Anything that is environmentally available, technologically accessible, culturally acceptable and capable of meeting our needs is called a resource.Resources include not only material things like water, air and soil but also non−material things like knowledge and health

2.What is Human resources ?

Resources include not only material things like water, air and soil but also non−material things like knowledge and health

3.On the basis of origin, resources can be mainly classified into natural resources and man−made resources.

Natural resources	Man−made resources
Resources obtained from nature. E.g., air, minerals,water,soil	Resources made by human beings E.g., road, machinery,buildins,vehicles

4.Can we use all the natural resources as we wish? Why can't all resources be used the same way?

@ not available everywhere @ runs out with use @ Some are harm to nature

5.The availability and renewability of natural resources varies. Resources can be classified into two categories based on their renewable potential.

Renewable Resources	Non−Renewable Resources
Resources that do not get depleted after use and can be reused are renewable resources. These are resources that are continuously produced in nature and are always readily available to man. Sunlight, wind and waves are examples of such resources	Non−renewable resources have been formed over millions of years and they decrease in quantity with use. Examples of such resources include iron, gold, coal, and petroleum.

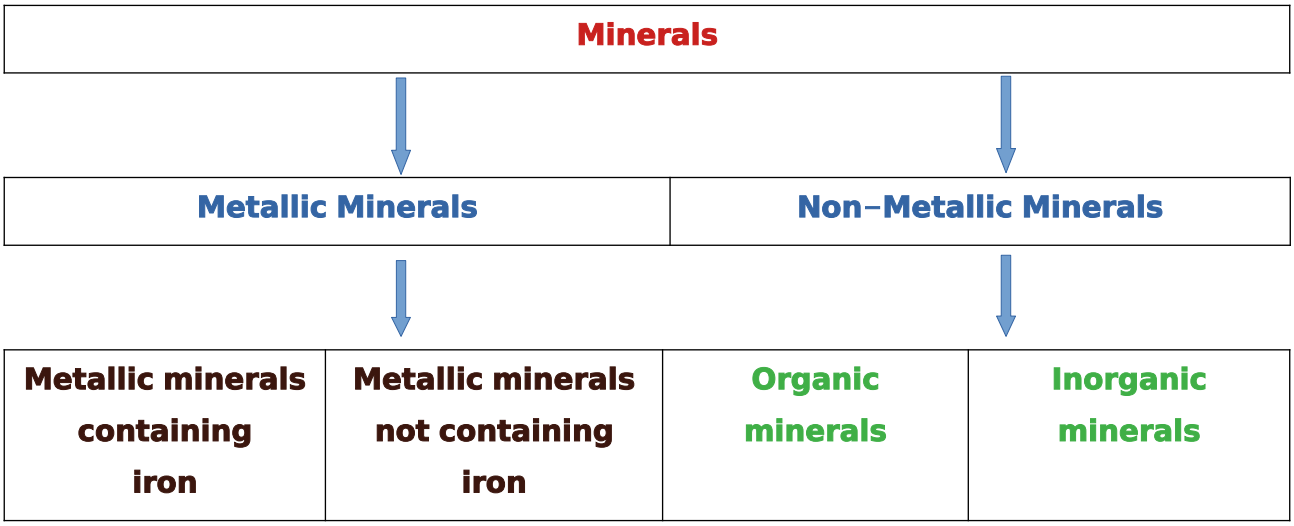

6.what are Minerals ?

Minerals are naturally forming organic and inorganic substances with chemical and physical properties. Examples include petroleum, iron ore, and bauxite. We cannot use these minerals directly.

7.Define Ores?

Minerals found in the Earth's crust in the form of ores become usable only after mining and processing. Minerals which will be mixed with impurities are mined from the earth in raw form. This is called ore. These ores can be converted into valuable minerals only through refining processes

8.Minerals can be classified into two types based on their composition and physical characteristics.What are they ?

9.Explain Metallic Minerals

Metallic minerals are naturally occurring substances in nature that contain traces of metal. The metal extracted from the metallic minerals through the refining process is usually hard and lustrous. An example of this is the extraction of aluminium from bauxite. Metallic minerals are classified into two types based on the presence of iron.

10.What are the features of Metallic Minerals

Ferrous metals	Non–ferrous metals
appear grey magnetic in nature heavy	appear in different colours non–magnetic relatively light weight

11.Elucidate Non–Metallic Minerals

Minerals that do not contain metals are called non–metallic minerals. For non–metallic minerals properties such as hardness, lustre and ductility are relatively low.

12.Non–metallic minerals are classified into two groups what are they ?

Organic minerals and Inorganic minerals. Biominerals such as coal and petroleum contain organic components whereas inorganic minerals such as graphite and clay contain inorganic components.

13.Uses of the given metallic and non–metallic minerals

Metallic minerals and uses	Non–metallic minerals and uses

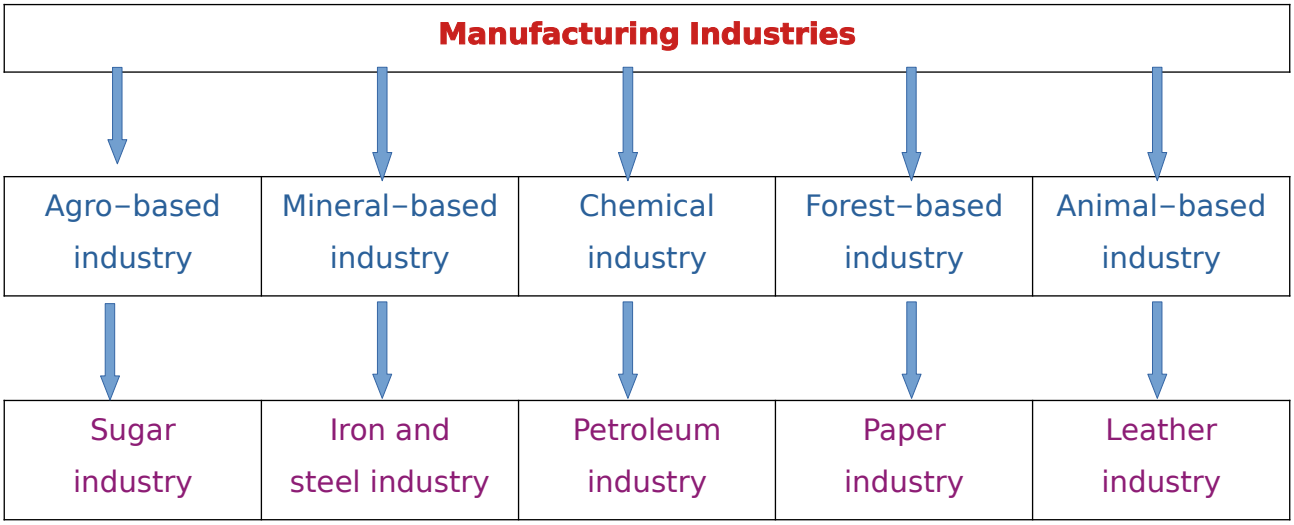

iron – construction gold –ornaments,medicine copper –electric equipments,utensils	graphite – pencil making petrol –fuel clay – pottery making,bricks

14.Major minerals and the states where they are distributed.

Minerals	States
Gold	Madhya Pradesh, Andhra Pradesh, Kerala, Karnataka and Jharkhand
Iron	Odisha, Jharkhand, and Chhattisgarh,Goa, Madhya Pradesh, Maharashtra, and Uttar Pradesh
Coal	Jharkhand, Odisha, Chhattisgarh, West Bengal, and Madhya Pradesh
Manganese	Madhya Pradesh, Maharashtra, Odisha, Karnataka, Andhra Pradesh

15.Write a short note on Manufacturing Industries in India

Minerals are useful for humans. These minerals play an important role in the country's production and industrial sectors. Minerals which are extracted through different refining processes are the main raw materials for industries. On the basis of raw materials, manufacturing industries can be mainly classified as follows

16.Complete the table based on Major manufacturing industries

Major manufacturing industries	States
Iron–Steel Industry	Odisha, West Bengal, Chhattisgarh
Cotton Industry	Gujarat, Maharashtra, Telangana, Andhra Pradesh, and Madhya Pradesh
Petrochemical Industry	Gujarat, Maharashtra, Andhra Pradesh, Tamil

	Nadu, and Odisha
Silk Industry	Karnataka,Andhra Pradesh,Tamil Nadu,West Bengal

17.The iron and steel industry is the foundation of industrial development and Indian economy .Evaluate the statement.

The iron and steel industry is called a basic industry as it provides the raw materials and products required for other industries. Iron and steel industry is also known as heavy industry. India is one of the largest producers of iron and steel in the world.The iron and steel industry supports the other industries and service sectors and increases the country's income. In addition, by creating employment opportunities, the standard of living of the people is also raised. In this way, the iron and steel industry plays an important role in the growth of the Indian economy

18.The first modern iron and steel industry in India; Tata Iron and Steel Company (TISCO) started in 1907 was established at Sakchi (Jamshedpur).

19.During the Second Five-Year Plan, three integrated iron and steel projects were started in

Iron and steel projects	**Funded by**
Bhilai	Soviet Union
Rourkela	Germany
Durgapur	Britain

20The iron and steel industries and the states

State	**Iron and steel industries**
Odisha	Rourkela, Paradweep, Kendujhargarh
Chhattisgarh	Raigarh,Bhilai Chandrapur
Andra Pradesh	Visakhapatnam
jharkhand	Bokaro,Jamshedpur
West Bengal	Durgapur

21.Factors Influencing the Distribution of Manufacturing Industries

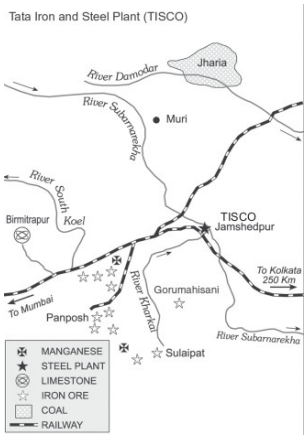

Factors

Geographical factors	Non–geographical factors
Topography,weather,water energy,raw materials	Capital,organisation,market,government policies,transportation,availability of labourers

22.Identify the factors that influenced the Tata Iron and Steel Plant from the figure

* availability of water (river)
* proximity to port (Kolkata)
* market (Kolkata, Mumbai)
* proximity to raw material deposits like iron ore, coal
* Transport Facilities
* Availability of Labor

23.What are the consequences of the manufacturing industries

Pollution ,Resource Depletion,Regional Inequality,Migration,Urbanisation are the consequences of the manufacturing industries.

Pollution is the undesirable consequences on the physical,chemical or biological characteristics of air, water and soil.Unscientific human activities cause pollution. This threatens the sustainability of the Earth and affects the regenerative capacity of the environment. Various Types of Pollution are

Air Pollution	The smoke emitted from industries which contain toxic gases such as sulphur dioxide, carbon dioxide, carbon monoxide and methane, pollute the atmosphere. This poses a serious threat to nature and human health.
Water Pollution	Waste water discharged from industries and toxins from chemical industries pollute rivers, lakes and other water bodies. It harmfully affects aquatic life and humans.
Soil Pollution	The waste and e–waste emitted from industries alter the natural structure of the soil. This has a detrimental effect on the agricultural sector and the environment.

Noise Pollution	Excessive noise emitted from industries adversely affects the physical and mental health of the people in the surrounding areas.

Resource Depletion–Unscientific use of resources in industries to increase production leads to resource depletion and environmental problems. Examples include deforestation, loss of soil fertility, and depletion of water and mineral resources.

Regional Inequality– The unbalanced distribution of natural resources and inadequate basic facilities have resulted in a concentration of industrial development in certain regions. Differences can be seen in the income and living standards of the people in these areas. This causes regional disparity in industrially backward areas.

Migration– Migration is the permanent or temporary movement of people from one region to another. People migrate from less developed areas to developed industrial areas for employment and better living conditions. It caused population density in this area.

Urbanisation – Urbanisation is the increase in size and population of cities as a result of migration from rural areas to urban areas and natural population growth in cities. This has led to a massive increase in the size and population of cities and it results in socio− economic and environmental changes.

24.What do you mean by Conservation of Resources ?

Conservation of resources is the process of ensuring their availability by avoiding over−exploitation through judicious use. The objectives of conservation of resources are to conserve resources for future generations, maintain the balance of the environment, and minimise impacts on nature and human beings.

25.What are the main resource conservation methods.

recycling of resources # water conservation # energy conservation # forest conservation # reuse of resources # soil conservation

26.Elucidate Sustainable Development

It aims to meet the needs of the present without compromising the ability of future generations to meet their own needs. Economic growth can be achieved through a balance between the welfare of the environment and the standard of living of the people. Recycling, reducing usage, and reusing resources are ways to achieve sustainable development. The Sustainable Development Goals are a collection of seventeen goals proposed by the United Nations in 2015 to achieve them by 2030.
